Shrey Ravi's GitHub 

Hi, my name is Shreyas "Shrey Ravi" Tallamraju, and welcome to my GitHub! Below is a repository list of projects I've worked on and what technologies I've used.

See my website at ShreyRavi.com or my LinkedIn for more information, or email me.

Technical Skills

Below is a breakdown of my technical skills. You can see projects using these technologies in the next section.

Frameworks	
Cloud/Databases/CI	
Graphics/Creative	
Machine Learning/AI	
Markup/Extensions	

Repository Portfolio

PaniPuriGame.com 

A live pani puri eating contest for a wedding stall: one laptop mirrored to a TV runs the crowd display, the 60-second timer, and the leaderboard. The webcam counts every bite with MediaPipe face tracking in a Web Worker, and a referee can confirm or discount each one by hotkey. Fully offline after the first load (bundled models, WASM, and service worker), and

private: no video leaves the laptop and nothing is recorded. Live at panipurigame.com, source at github.com/ShreyRavi/pani-puri-contest.

Watch the full demo video

---

atlas-trails

NEXT.JS TYPESCRIPT VERCEL

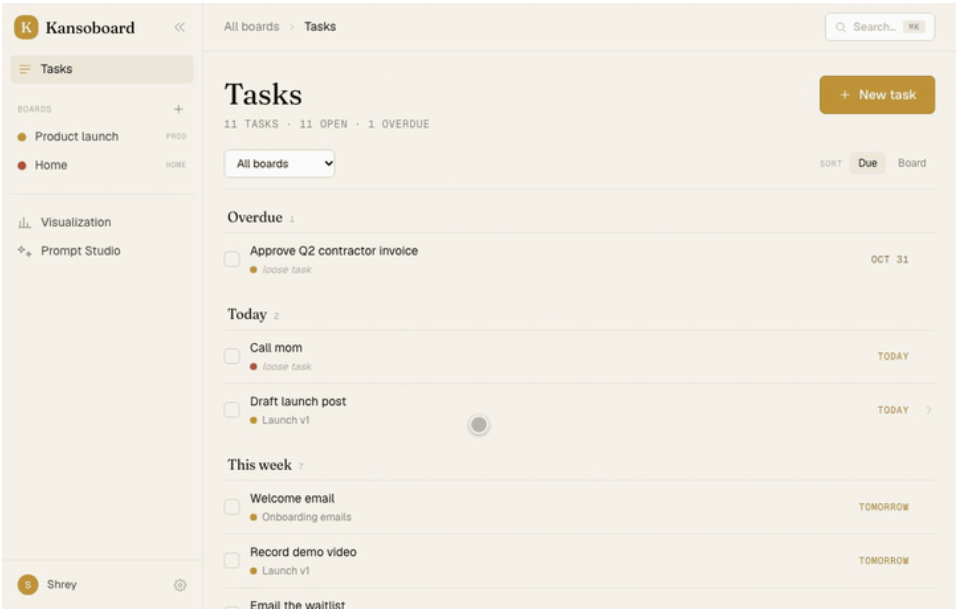

Live at https://atlas.kansoboard.com/. Travel journal PWA where users log trips, drop pins on an interactive world map, and build a personal cartographic record. Cross-platform and users have shared over 1,000+ journeys! Source at github.com/ShreyRavi/atlas-trails.

Kansoboard.com: the Kansotool Suite

NEXT.JS TYPESCRIPT SUPABASE TAURI

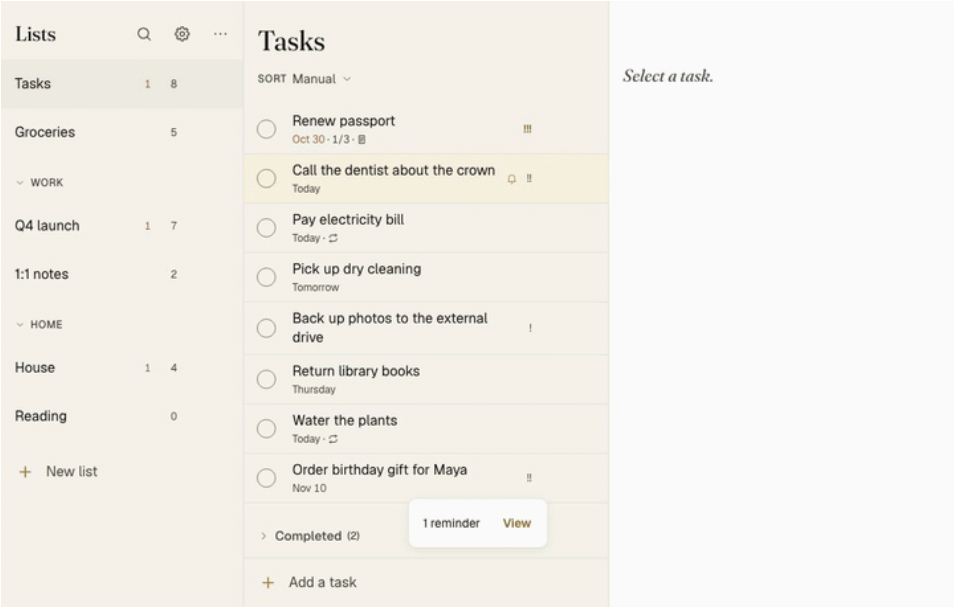

Calm, minimalist software for everyday work, named after kanso (簡素), the Japanese aesthetic of simplicity. A suite of focused tools for writing, planning, and getting things done, designed to be fast, private, and secure: local-first by default, no ads or trackers, two-factor auth and row-level security where there is a server, performance budgets measured on every release, and the same product on the web and as a native desktop app. See the whole suite at kansoboard.com.

Kansoboard · *Private beta*

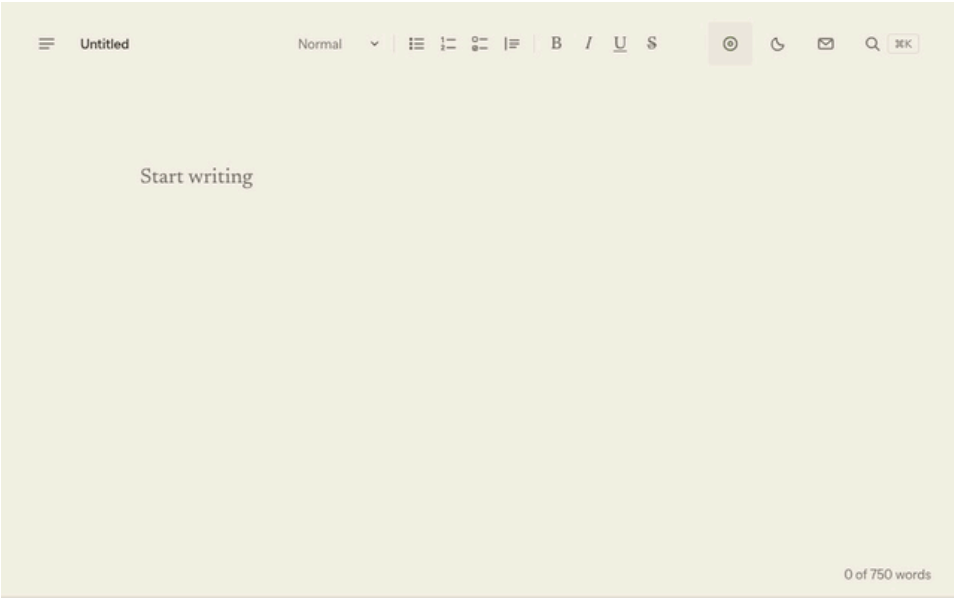

A calm Kanban board and task list in one. Multi-step work lives on shareable boards as cards; single to-dos are tasks that sit inside a card or loose across every board. Keyboard-first (⌘K) and built for teams of 2–15. Optimistic drag-and-drop with writes serialized per board, encrypted backups (a passphrase-wrapped ECDH P-256 key plus a device copy that opens with no server), and board consistency enforced by Postgres row-level security. Built on Next.js 16, React 19, Supabase, TanStack Query, and dnd-kit.

Kansotodo · *Private beta*

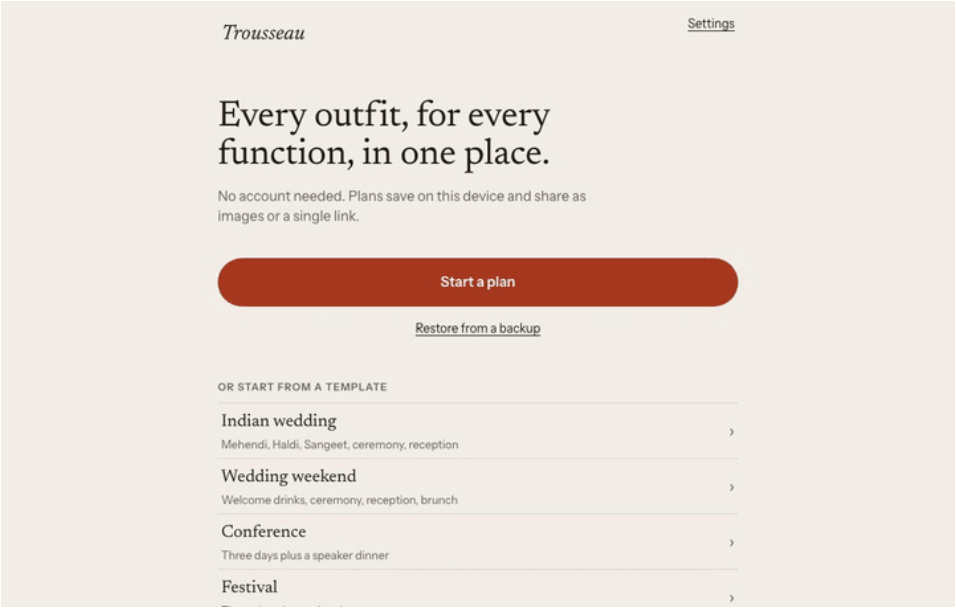

Your lists, ordered your way: priorities that mean something and your own order within every day. Offline-first with an AES-GCM encrypted local cache and a replayable mutation queue, required TOTP two-factor enforced in row-level security, a strict hash-based CSP, and 360+ pgTAP tests. Built on Next.js 15, React 19, Supabase Realtime, and a Tauri 2 Mac app.

Kansowriter · *Live*

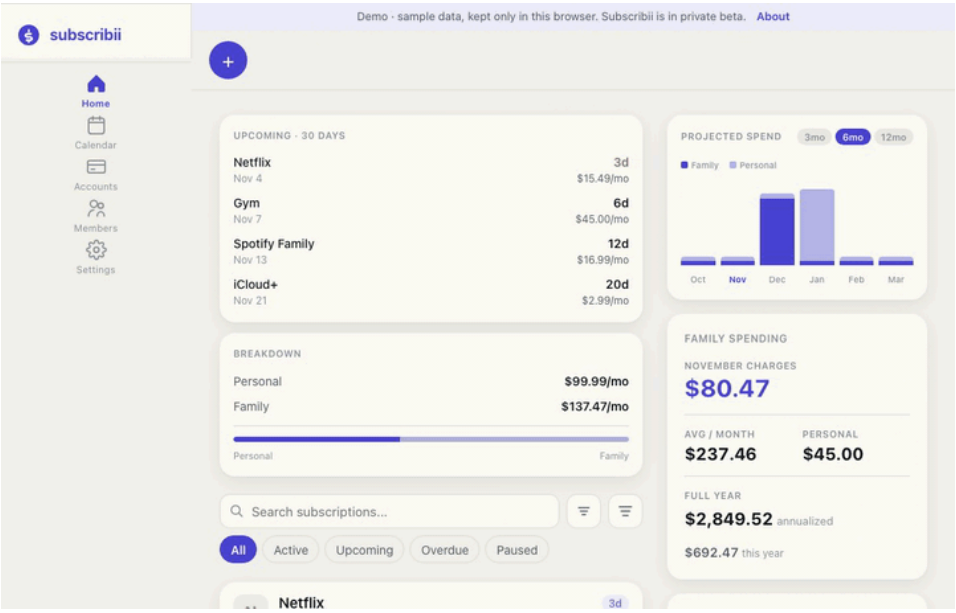

A quiet place to write. A distraction-free CodeMirror 6 Markdown editor with paper and night themes; drafts stay on your device (Dexie/IndexedDB) and there is no account. Runs on the web and as a native macOS app via Tauri that edits .md files in place. Live at writer.kansoboard.com, source at github.com/ShreyRavi/kansowriter.

Trousseau · *Live*

Plan every outfit for every function of a multi-day event, like a five-function Indian wedding. Start from a template, capture items from photos or links, see which slots are still missing, and share the plan as WhatsApp-ready images or a single link that never touches a server. No account: an installable offline PWA with local storage and backup files. Live at clothes.kansoboard.com, source at github.com/ShreyRavi/clothes-planner.

Subscribii · *Live demo*

Every subscription and your net worth, for the whole family, in one encrypted file on your own computer. No accounts, no servers, no bank logins: the family file is sealed with XChaCha20-Poly1305 and Argon2id key slots for a password and a recovery phrase, implemented in Rust.

Renewal dates, per-member spend, and the household's monthly and yearly totals at a glance. Built on Next.js 16, React 19, and a Tauri 2 desktop app; the web demo at finance.kansoboard.com runs on sample data in your browser.

---

dibs.events

Frictionless shared to-do lists for ad-hoc group plans - a birthday, a trip, a potluck. Drop the link in any chat and everyone claims what they'll do, with no app and no login. A companion to Kansoboard, built on Next.js 15, Supabase, and Tailwind. Source at github.com/ShreyRavi/dibs.

---

workmode.org

Chrome extension that blocks distracting websites, with 10,000+ active users. Source at github.com/ShreyRavi/workmode.

---

tournabracket

No-login, offline-first tournament bracket generator with a retro pixel and Olympic look. Supports single and double elimination, round robin, Swiss, and 3-game guarantee, with drag-and-drop seeding and undo/redo. The whole tournament is compressed into the URL, so sharing a link hands over the bracket. Live at https://bracket.kansoboard.com/.

---

orbit-crafter

Real-time N-body physics sandbox with gravitational interactions computed entirely on the GPU via WebGPU compute shaders and WGSL, handling thousands of bodies at interactive frame rates. No CPU-side physics loop.

---

chip8-rs

CHIP-8 emulator written in Rust with full instruction set coverage, display output, and keyboard input handling. A from-scratch systems programming exercise with no emulation libraries.

---

rust-life-gpu

RUST WGPU

GPU-parallelized cellular automaton in Rust and wgpu, running Conway's Game of Life and configurable rule sets at real-time frame rates across large grids. Each generation is computed in a single GPU dispatch rather than cell-by-cell on the CPU.

Clipstasher (MacOS)

Swift macOS

A privacy-first macOS menu bar app that captures your clipboard history locally. Open source, zero telemetry, no cloud sync. Source at github.com/ShreyRavi/clipstasher.

---

simplex-diff-checker

JAVASCRIPT HTML5

Privacy-first text diff checker: paste two versions of a document and see changes highlighted like Word's Track Changes. Runs entirely in the browser with a Web Worker for large inputs, self-hosted fonts, no CDN, and zero network requests. Works offline. Source at github.com/ShreyRavi/simplex-diff-checker.

---

shrey-os

TYPESCRIPT CLAUDE

Personal AI operating system built on gstack with domain-specific skills including /gtm-plan, /hiring-decision, /pricing-strategy, /board-update, and /decision-framework. Functions as a structured reasoning environment for founder-level decisions rather than a general-purpose chat interface.

---

prosemirror-toc

JAVASCRIPT

Table of contents plugin for ProseMirror that auto-generates and syncs a TOC from document heading nodes.

---

tui.table-of-contents

JAVASCRIPT

Published npm plugin that adds table of contents generation to the Toast UI Editor.

---

tui.citation JAVASCRIPT

Citation insertion plugin for Toast UI Editor, adding formatted inline citation support to the editor toolbar.

---

walk-safe-home REACT JAVASCRIPT HEROKU

Personal safety app with a panic button, geo-location tracking, and Twilio SMS integration for emergency contact alerts. Source at github.com/ShreyRavi/walk-safe-home.

---

covid-19-sms PYTHON FLASK HEROKU

Twilio-powered SMS service returning localized COVID-19 case and death statistics by zip code, state, or city, built on Python, Flask, Pandas, and NumPy. DEV.to hackathon project.

---

covid-19-data-visualization REACT PYTHON FLASK

Full-stack COVID-19 data visualization with a React and Material UI frontend consuming a Python/Flask REST API, deployed on Heroku.

---

lang-simpleboolean TYPESCRIPT

Published npm package implementing a boolean-based syntax language for CodeMirror 6, including tokenizer, parser, and highlighting support.

SolarSystem PYTHON

Newtonian solar system simulation with PyGame rendering, modeling gravitational attraction between bodies using real physical constants.

---

codemirror-6-react-example

REACT JAVASCRIPT

Minimal reference integration showing how to embed a CodeMirror 6 editor instance inside a React component tree with controlled state.

---

decrypt-caesar

JAVASCRIPT

Published npm package that decrypts Caesar shift ciphers without knowing the shift value, using frequency analysis to identify the most probable plaintext.

---

js-game-of-life

JAVASCRIPT HTML5

Conway's Game of Life in vanilla JavaScript with no dependencies, written for readability over performance. Source at github.com/ShreyRavi/js-game-of-life.

---

react-calculator

REACT TYPESCRIPT

Calculator built in React and TypeScript as a reference implementation of controlled components and typed event handling.

---

noimage Chrome Extension

JAVASCRIPT HTML5

Chrome extension that removes all image elements from any page on activation, useful for low-bandwidth browsing or distraction reduction.

---

tui-editor-example

JAVASCRIPT

Testbed used during development of the tui.table-of-contents and tui.citation plugins for Toast UI Editor.

---

etch-a-sketch-js

Browser-based Etch-a-Sketch with a resizable grid and color options, built for The Odin Project curriculum.

Published Packages / Software

1. npm - lang-simpleboolean
2. npm - decrypt-caesar
3. npm - tui-table-of-contents
4. npm - theme-simple-white
